## FIBROBLAST PLASMA THERAPY - AFTERCARE INFORMATION

- Immediately after treatment, there may be a burning sensation. This will usually resolve during the remainder of the day, although if it is particularly uncomfortable or persists for a longer period, then an anti-inflammatory medication such as ibuprofen can be taken.
- Following treatment, it is normal to have some swelling. This can be significant around the eyes and can last for several days and may lead to interference with vision in the initial period. Cold compresses may be applied to reduce the swelling. If the swelling is more severe, an anti-inflammatory medication and/or anti-histamine may help alleviate the swelling.
- Crusting will usually develop over the treated area, this will often initially be brown or black on the surface of the skin and flake off over the following days. It may take over 2 weeks to completely disappear. It is essential to not pick at this crusting as this may lead to infection or scarring.
- Occasionally the treated area may become a little weepy, this is part of the normal healing process and will improve with time. However, if it starts to become hot or red or if there is any pus present, then please contact the salon for advice as this may suggest an infection has developed.
- It is essential to keep the treatment area clean, dry and protected with a broad spectrum sunscreen.
- Do not use alcohol-based cleansers.
- It is very important to follow our aftercare recommendations.
- Carbon crusts CANNOT be scratched or removed.
- Drying skin by dabbing with a clean, lint-free cloth is allowed.
- Purebeau aftercare cream should be applied to the area. The aftercare cream is available for purchase from our salon.
- Healing skin should be protected from direct sun with SPF50 cream.
- Sports, swimming and sauna are not permitted until crusts fall off. This should happen within 7-14 days of procedure.

### Should I watch for any unusual complications?

Fibroblast Plasma Therapy is very safe but in some rare occasions, complications may occur. Please inform your Fibroblast Specialist immediately in case of any unusual symptoms. This may include signs of infection such as excessive redness, pus, blistering or thick, yellow crust forming in treatment area.

### Can I use cosmetics after the procedure?

The treated skin area can be covered with the prescribed medical tinted aftercare cream. Clients may use mineral powder only on top of the aftercare cream. Please avoid any moisturizing creams for 5-10 days. This is when usually when carbon crusts fall off. In addition, patients need to avoid all direct heat sources such as sun, UV radiation, saunas etc for the period of at least 4 weeks. Once healed, we highly recommend using an SP-50 sunscreen on the area to prevent ageing and hyperpigmentation caused by sun exposure.
